

Lip repositioning surgery & botulinum toxin – A Double Approach for gummy smile patients

Noury Adel

¹Oral and Maxillofacial Surgery Specialist, Cairo, Egypt.

Abstract:

In recent years, many patients have grown an interest in beauty and cosmetic procedures. Multiple methods for achieving beauty have been suggested where dermatologists and plastic surgeons have been using surgical and non-surgical methods for beauty enhancement, it is without a doubt that dentists are concerned with facial beautification as much as any other specialty where each facial sub-unit plays a role in the overall appearance especially the lips that's considered to be the curtain of the smile framework. Over the years several invasive techniques have been advocated to address the gummy smile, however now days neurotoxins have become a mainstream modality due to their minimal downtime, lower incidence of postoperative complications and the chance for an office based aesthetic intervention. Neurotoxins can be effectively used as a temporary treatment for the gummy smile either alone or as an adjunct to other surgeries, it is of no doubt that proper case assessment is of great importance. By analyzing evidence-based data and understanding different injection techniques for gummy smile treatment where each technique has its own merits and demerits. Proper knowledge on how to combine neurotoxins with into our facial-dental practice will help you to master a technique that will set you apart from most routine cosmetic treatment not to mention that it will enable you to take a step forward into the future of advanced aesthetic procedures where formulating the appropriate aesthetic treatment plan is mandatory for achieving a satisfactory result for the patients and your practice
